Hunting for New Physics

Belle II: particle physics experiment that belongs to the *Intensity Frontier*
New Physics (NP) is searched in:

- very high-precision measurements to detect (tiny) deviations from SM predictions produced by virtual New Physics particles
- SM-forbidden processes enabled by the presence of virtual NP particles in box / loops / ...

What is needed at the intensity frontier?

- A larger dataset to minimise statistical uncertainty
- Keep systematics under control

SuperKEKB
e⁺ e⁻ collider at $\sqrt{s} \sim 10$ GeV
Y(4S) mass energy

Belle II experiment @ SuperKEKB

Belle II: multi-purpose detector designed to reconstruct *all** particles from the $e^+ e^-$ collision

Well suited for inclusive analyses & missing energy measurements

- 90% solid angle coverage & known initial state

Excellent vertexing & high-efficiency detection of neutrals (γ , π^0 , η , η' , ...)

(*) particles that interact with the detector

Belle II

Initial energy & momentum
 (\sqrt{s}) (M_{hadron})

u or e^+e^-

$e^+e^- \rightarrow u\bar{u}$

"A bit like reading tracks in the snow"

Detectors are giant 3D cameras. We compare what comes out from the collisions (data) with the expectations (what we know from physics models, etc.)

A bit like reading tracks in the snow

From Nature to Dots

Tracking is a (fun) challenge!

Belle II tracking: excellent performance

Belle II tracking: excellent performance

Belle II tracking: desirable improvement

Belle II tracking: desirable improvement

Belle II tracking: desirable improvement

Cellular Automaton (CA) as additional algorithm to improve track reconstruction of non-prompt tracks

- Displaced vertices are challenging

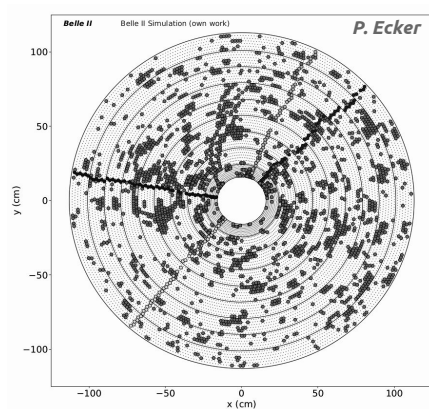

Belle II tracking: desirable improvement

Cellular Automaton (CA) as additional algorithm to improve track reconstruction of non-prompt tracks

- Displaced vertices are challenging

Main challenge

- Improve the track-finding efficiency without degrading the number of wrongly reconstructed track (*fake rate*)
