

The 19th International Workshop on Neutrinos from Accelerators (NUFACT2017)

Contribution ID: 26

Type: **talk**

Prospects of LFV studies at Belle II

Thursday, 28 September 2017 14:00 (24 minutes)

The Belle II experiment at the SuperKEKB collider is a major upgrade of the KEK “B factory” facility in Tsukuba, Japan. The machine is designed for an instantaneous luminosity of $8 \times 10^{35} \text{ cm}^{-2} \text{s}^{-1}$, and the experiment is expected to accumulate a data sample of about 50 ab^{-1} in five years of running. With this amount of data, decays sensitive to physics beyond the Standard Model and cLFV can be studied with unprecedented precision. One promising set of modes are physics processes containing neutrinos which are characterized by missing energy.

Topics which will be discussed are: Lepton number violation in τ decays, Violation of lepton universality in $b \rightarrow c(\tau/l)\nu$, Violation of lepton universality in $b \rightarrow sll$
