

LHC Signals of Some Unusual Dark Matter Scenarios

Biswarup Mukhopadhyaya
Regional Centre for Accelerator-based Particle Physics
Harish-Chandra Research Institute
Allahabad, India

Uppsala University, April, 2017

The central theme:

If the dark matter candidate is an elementary particle not commonly thought of in that role, it may shift the paradigm of new physics search in accelerator experiments, too.

The LHC...

$$p \Rightarrow \Leftarrow p$$
$$E_{cm} = 7/8/13/14 \text{ TeV}$$

The sequence of various layers of a detector has a particular logic.....

A unique signal for every kind....

If the LHC produces.....

- *Some particle(s) having neither strong nor electromagnetic interaction*

If the LHC produces.....

- *Some particle(s) having neither strong nor electromagnetic interaction*
- *Not detected in any part of the detector*

If the LHC produces.....

- *Some particle(s) having neither strong nor electromagnetic interaction*
- *Not detected in any part of the detector*
- *The only signal of such particles: imbalance of transverse momentum of all visible particles 'MET'*

If the LHC produces.....

- *Some particle(s) having neither strong nor electromagnetic interaction*
- *Not detected in any part of the detector*
- *The only signal of such particles: imbalance of transverse momentum of all visible particles 'MET'*
- *The standard model candidates for MET: the three neutrinos*

If the LHC produces.....

- *Some particle(s) having neither strong nor electromagnetic interaction*
- *Not detected in any part of the detector*
- *The only signal of such particles: imbalance of transverse momentum of all visible particles 'MET'*
- *The standard model candidates for MET: the three neutrinos*
- *Any additional 'invisible' particles*
 - ⇒ *Events with MET even after 'subtracting' the effect of neutrinos*

If the LHC produces.....

- *Some particle(s) having neither strong nor electromagnetic interaction*
- *Not detected in any part of the detector*
- *The only signal of such particles: imbalance of transverse momentum of all visible particles 'MET'*
- *The standard model candidates for MET: the three neutrinos*
- *Any additional 'invisible' particles*
 - ⇒ *Events with MET even after 'subtracting' the effect of neutrinos*
- *Particle(s) constituting dark matter can have such signals*

Dark matter is indicated/expected to show up in....

- *Galactic rotation curves*

Dark matter is indicated/expected to show up in....

- *Galactic rotation curves*
- *CMBR anisotropy*

Dark matter is indicated/expected to show up in....

- *Galactic rotation curves*
- *CMBR anisotropy*
- *Observation of bullet clusters*

Dark matter is indicated/expected to show up in....

- *Galactic rotation curves*
- *CMBR anisotropy*
- *Observation of bullet clusters*
- *Observation of γ -ray signals, excess positrons, excess in galactic antiproton/proton ratio....*

Dark matter is indicated/expected to show up in....

- *Galactic rotation curves*
- *CMBR anisotropy*
- *Observation of bullet clusters*
- *Observation of γ -ray signals, excess positrons, excess in galactic antiproton/proton ratio....*
- *Outcomes of direct search experiments*

Dark matter is indicated/expected to show up in....

- *Galactic rotation curves*
- *CMBR anisotropy*
- *Observation of bullet clusters*
- *Observation of γ -ray signals, excess positrons, excess in galactic antiproton/proton ratio....*
- *Outcomes of direct search experiments*
- *Missing energy in collider experiments (Attempt to reconstruct masses from m_{T2} , m_{cT} , $\sqrt{\hat{s}}_{min}, \dots$)*

- *Scenarios beyond the standard model suggested.*

- *Scenarios beyond the standard model suggested.*
- *Need to accommodate a something that does not decay into standard model particles.*

- *Scenarios beyond the standard model suggested.*
- *Need to accommodate a something that does not decay into standard model particles.*
- *Some discrete (Z_2 ?) symmetry*

Most proposed scenarios faces constraints from...

- *Various direct search experiments—mostly spin-independent scattering cross-sections with nucleons.*

Most proposed scenarios faces constraints from...

- *Various direct search experiments—mostly spin-independent scattering cross-sections with nucleons.*
- *Relic density in the case of thermal DM—via Boltzmann equation*

Most proposed scenarios faces constraints from...

- *Various direct search experiments—mostly spin-independent scattering cross-sections with nucleons.*
- *Relic density in the case of thermal DM—via Boltzmann equation*
- *Light element abundance.*

Most proposed scenarios faces constraints from...

- *Various direct search experiments—mostly spin-independent scattering cross-sections with nucleons.*
- *Relic density in the case of thermal DM—via Boltzmann equation*
- *Light element abundance.*
- *Various astro-cosmo data (time-dependent!)*

There can still be scenarios, where....

- *DM-related issues face some twist for certain particle spectra*
 - ⇒ *Change in the basic paradigm for formulating/probing new physics*

Example:

There can still be scenarios, where....

- *DM-related issues face some twist for certain particle spectra*
⇒ *Change in the basic paradigm for formulating/probing new physics*

Example:

- *The DM candidate has very feeble interaction*
+
The signal is NOT missing energy/momentum at collider experiments

There can still be scenarios, where....

- *DM-related issues face some twist for certain particle spectra*
⇒ *Change in the basic paradigm for formulating/probing new physics*

Example:

- *The DM candidate has very feeble interaction*
+
The signal is NOT missing energy/momentum at collider experiments
- *The constraints from DM elastic scattering disappears, due to some feature of the spectrum*
⇒ *New collider signals*

.....

Points illustrated in the context of supersymmetry (SUSY)

SUSY: The action has a boson-fermion symmetry

⇒ A boson for every fermion and vice versa

SUSY with particle-superpartner split \simeq TeV avoids unacceptable shifts in the Higgs boson mass via higher-order corrections

SUSY ⇒ A DM candidate arising in a 'not-so-artificial' manner

However, similar possibilities in non-SUSY contexts can be of interest

Carrying more than 100 additional free parameters...

Minimal SUSY Standard Model (MSSM)

Chiral superfields:

Names		spin 0	spin 1/2	$SU(3)_C, SU(2)_L, U(1)_Y$
squarks, quarks (3 families)	Q	$(\tilde{u}_L \ \tilde{d}_L)$	$(u_L \ d_L)$	$(\mathbf{3}, \mathbf{2}, \frac{1}{6})$
	U^c	\tilde{u}_R^*	u_R^\dagger	$(\bar{\mathbf{3}}, \mathbf{1}, -\frac{2}{3})$
	D^c	\tilde{d}_R^*	d_R^\dagger	$(\bar{\mathbf{3}}, \mathbf{1}, \frac{1}{3})$
sleptons, leptons (3 families)	L	$(\tilde{\nu} \ \tilde{e}_L)$	$(\nu \ e_L)$	$(\mathbf{1}, \mathbf{2}, -\frac{1}{2})$
	E^c	\tilde{e}_R^*	e_R^\dagger	$(\mathbf{1}, \mathbf{1}, \mathbf{1})$
Higgs, higgsinos	H_u	$(H_u^+ \ H_u^0)$	$(\tilde{H}_u^+ \ \tilde{H}_u^0)$	$(\mathbf{1}, \mathbf{2}, +\frac{1}{2})$
	H_d	$(H_d^0 \ H_d^-)$	$(\tilde{H}_d^0 \ \tilde{H}_d^-)$	$(\mathbf{1}, \mathbf{2}, -\frac{1}{2})$

Gauge superfields :

Names	spin 1/2	spin 1	$SU(3)_C, SU(2)_L, U(1)_Y$
gluino, gluon	\tilde{g}	g	$(\mathbf{8}, \mathbf{1}, \mathbf{0})$
winos, W bosons	$\tilde{W}^\pm \ \tilde{W}^0$	$W^\pm \ W^0$	$(\mathbf{1}, \mathbf{3}, \mathbf{0})$
binos, B boson	\tilde{B}^0	B^0	$(\mathbf{1}, \mathbf{1}, \mathbf{0})$

Physical states important in phenomenology:

Charginos: $\chi_{1,2}^{\pm} = (\dots)\tilde{W}^{\pm} + (\dots)\tilde{H}^{\pm}$

Neutralinos: $\chi_{1,2,3,4}^0 = (\dots)\tilde{B} + \tilde{W}^3 + (\dots)\tilde{H}_1^0 + (\dots)\tilde{H}_2^0$

In a supersymmetric scenario....

- $R = (-)^{(3B+L+2J)}$ is
+1 for all SM particles, -1 for superparticles
 R conserved multiplicatively, if no B/L violation
by odd units

In a supersymmetric scenario....

- $R = (-)^{(3B+L+2J)}$ is
+1 for all SM particles, -1 for superparticles
 R conserved multiplicatively, if no B/L violation
by odd units
- R -conserving SUSY \Rightarrow the lightest superparticle
is stable

In a supersymmetric scenario....

- $R = (-)^{(3B+L+2J)}$ is
+1 for all SM particles, -1 for superparticles
 R conserved multiplicatively, if no B/L violation
by odd units
- R -conserving SUSY \Rightarrow the lightest superparticle
is stable
- A source of Missing E_T at the LHC:
A dark matter candidate
(Subject to direct search + relic density
constraints)

In a supersymmetric scenario....

- $R = (-)^{(3B+L+2J)}$ is
+1 for all SM particles, -1 for superparticles
 R conserved multiplicatively, if no B/L violation
by odd units
- R -conserving SUSY \Rightarrow the lightest superparticle
is stable
- A source of Missing E_T at the LHC:
A dark matter candidate
(Subject to direct search + relic density
constraints)
- The most suitable candidate in MSSM:
the lightest neutralino (χ_1^0)

In a supersymmetric scenario....

- $R = (-)^{(3B+L+2J)}$ is
+1 for all SM particles, -1 for superparticles
 R conserved multiplicatively, if no B/L violation
by odd units
- R -conserving SUSY \Rightarrow the lightest superparticle
is stable
- A source of Missing E_T at the LHC:
A dark matter candidate
(Subject to direct search + relic density
constraints)
- The most suitable candidate in MSSM:
the lightest neutralino (χ_1^0)
- Expected signal of SUSY with a DM candidate:
MET + jets/leptons/photons

The MSSM and ATLAS search limits...

ATLAS SUSY Searches* - 95% CL Lower Limits

*Only a selection of the available mass limits on new states or phenomena is shown.

10⁻¹ 1 Mass scale [TeV]

The MSSM and CMS search limits...

'SUSY with organising principles': proposed for having fewer free parameters

Constrained MSSM (cMSSM) based on minimal supergravity:

Everything determined by

$m_0, m_{1/2}, A_0, \tan \beta, \text{Sgn}(\mu)$

$m_0 =$ high-scale universal scalar mass (spin-0)

$m_{1/2} =$ high-scale universal gaugino mass (spin-1/2)

LHC data+DM constraints+observed m_h

*\Rightarrow strong constraints
(more on this later)*

SUSY with a right sneutrino LSP...

- *The MSSM has no right-handed neutrino or its superpartner*

SUSY with a right sneutrino LSP...

- *The MSSM has no right-handed neutrino or its superpartner*
- *The term $y_\nu l_L^c \nu_R H_2$ is absent in the superpotential*

SUSY with a right sneutrino LSP...

- *The MSSM has no right-handed neutrino or its superpartner*
- *The term $y_\nu l_L^c \nu_R H_2$ is absent in the superpotential*
- *If neutrinos have just Dirac mass, then this term could be present*
 - $\Rightarrow \tilde{\nu}_R$ is there:
 - \Rightarrow Another potential DM candidate

SUSY with a right sneutrino LSP...

- *The MSSM has no right-handed neutrino or its superpartner*
- *The term $y_\nu l_L^c \nu_R H_2$ is absent in the superpotential*
- *If neutrinos have just Dirac mass, then this term could be present*
 - $\Rightarrow \tilde{\nu}_R$ is there:
 - \Rightarrow Another potential DM candidate
- *$\tilde{\nu}_R$ is a gauge singlet: ultra-feeble interactions*
 - \Rightarrow It forms non-thermal DM

SUSY with a right sneutrino LSP...

- *The MSSM has no right-handed neutrino or its superpartner*
- *The term $y_\nu l_L^c \nu_R H_2$ is absent in the superpotential*
- *If neutrinos have just Dirac mass, then this term could be present*
 - $\Rightarrow \tilde{\nu}_R$ is there:
 - \Rightarrow Another potential DM candidate
- *$\tilde{\nu}_R$ is a gauge singlet: ultra-feeble interactions*
 - \Rightarrow It forms non-thermal DM
- *The next-to-lightest SUSY particle (LSP) does not decay into the LSP within collider detectors:*
 - \Rightarrow new collider signals

Features that a right sneutrino LSP brings in....

- *In the superpotential:*

$$\text{Terms} \sim y_\nu l_L^c \nu_R H_u \Rightarrow m_\nu^D = y_\nu \langle H_u \rangle$$

Features that a right sneutrino LSP brings in....

- *In the superpotential:*

$$\text{Terms} \sim y_\nu l_L^c \nu_R H_u \Rightarrow m_\nu^D = y_\nu \langle H_u \rangle$$

- *In the scalar potential:*

$$-\mathcal{L}_{\text{soft}} \sim M_{\tilde{\nu}_R}^2 |\tilde{\nu}_R|^2 + (y_\nu A_\nu H_u \cdot \tilde{L} \tilde{\nu}_R^c + \text{h.c.})$$

Features that a right sneutrino LSP brings in....

- *In the superpotential:*
Terms $\sim y_\nu l_L^c \nu_R H_u \Rightarrow m_\nu^D = y_\nu \langle H_u \rangle$
- *In the scalar potential:*
 $-\mathcal{L}_{\text{soft}} \sim M_{\tilde{\nu}_R}^2 |\tilde{\nu}_R|^2 + (y_\nu A_\nu H_u \cdot \tilde{L} \tilde{\nu}_R^c + \text{h.c.})$
- *The low-scale sneutrino mass matrix:*

$$m_{\tilde{\nu}}^2 = \begin{pmatrix} M_{\tilde{L}}^2 + \frac{1}{2} m_Z^2 \cos 2\beta & y_\nu v (A_\nu \sin \beta - \mu \cos \beta) \\ y_\nu v (A_\nu \sin \beta - \mu \cos \beta) & M_{\tilde{\nu}_R}^2 \end{pmatrix}$$

$M_{\tilde{L}}$ = soft mass for the left-handed sleptons

$M_{\tilde{\nu}_R}$ = soft mass for the right-handed sneutrino

In general, $M_{\tilde{L}} \neq M_{\tilde{\nu}_R}$ because of different evolution patterns + D-term contribution for the former.

Physical states: $\tilde{\nu}_1$ (lighter), $\tilde{\nu}_2$ (heavier)

Features that a right sneutrino LSP brings in....

With high-scale SUSY breaking generating $M_{\tilde{\nu}_R}$,

$$\frac{dM_{\tilde{\nu}_R}^2}{dt} = \frac{2}{16\pi^2} y_\nu^2 A_\nu^2$$

Extremely small Yukawa couplings

$\Rightarrow M_{\tilde{\nu}_R}$ *nearly frozen at the high-scale value*

Other sfermion masses are jacked up at the electroweak scale

\Rightarrow *A right-chiral sneutrino for every family is at the bottom of the spectrum*

(May or may not be equal to m_0)

Features that a right sneutrino LSP brings in....

The LSP state(s) = $\tilde{\nu}_1$

Dominantly $\tilde{\nu}_R$, with admixture of $\tilde{\nu}_L \sim y_\nu$

All decay widths into $\tilde{\nu}_1$ is $\sim y_\nu^2$

Extremely suppressed– decay takes place outside detector

Within the detector, all decays lead to the NLSP

The NLSP controls collider phenomenology

Example: For a stau-NLSP, there will be long-lived charged tracks

Signal: tracks in the tracker/muon chamber + jets + leptons

No Missing- E_T signal for SUSY, in spite of a DM candidate in the spectrum

The $\tilde{\nu}_R$ changes signals simply by doing nothing

Gregory (Scotland Yard detective): "Is there any other point to which you would wish to draw my attention?"

Holmes: "To the curious incident of the dog in the night-time."

Gregory: "The dog did nothing in the night-time."

Holmes: "That was the curious incident."

*Silver Blaze in The Memoirs of Sherlock Holmes
by Sir Arthur Conan Doyle*

*The stable tracks will leave their mark in the tracking chamber,
and will also arrive at the muon chamber
Thus they need to be distinguished from muons*

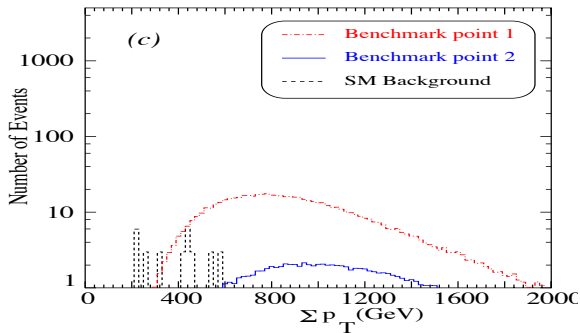

Ways to separate the stable tracks from muons: p_T (track)...

The distribution is much harder for $\tilde{\nu}_1$ -LSP:

S. K. Gupta + BM + S. K. Rai (2007), S. Biswas + BM (2010)

Ways to separate: $\Sigma|p_T|...$

Also used: Time-delay between inner tracker and muon chamber, 'stopper detector', dE/dx measurements...

K. Hamaguchi, M. Nojiri, A. de Roeck (2006), CMS (2011), ATLAS (2015)...

- *Model-independent mass limits from stable charged track search at (8 + 13) TeV LHC: ≈ 360 GeV*

- *Model-independent mass limits from stable charged track search at (8 + 13) TeV LHC: ≈ 360 GeV*
- *Question: Do the constraints on mSUGRA-based cMSSM change for a $\tilde{\nu}_R$ DM? Yes, because*
 - (a) *$m_{\tilde{\tau}_1} < m_{\chi_1^0}$ now allowed*
 - (b) *The DM is non-thermal now*

S. Banerjee, G. Belanger, BM, P. D. Serpico, JHEP 07 (2016) 095

The limits on cMSSM with χ_1^0 DM are strong because....

- $m_0, m_{1/2}$ *also affect Higgs mass(es)*

The limits on cMSSM with χ_1^0 DM are strong because....

- $m_0, m_{1/2}$ also affect Higgs mass(es)
- Direct search limits going up
 \Rightarrow some annihilation channels become ineffective

The limits on cMSSM with χ_1^0 DM are strong because....

- $m_0, m_{1/2}$ also affect Higgs mass(es)
- Direct search limits going up
 \Rightarrow some annihilation channels become ineffective
- $m_{\tilde{g}}, m_{\chi_1^0}, m_{\chi_1^\pm}$ are related: so are $m_{\tilde{q}, \tilde{\ell}}$

The limits on cMSSM with χ_1^0 DM are strong because....

- $m_0, m_{1/2}$ also affect Higgs mass(es)
- Direct search limits going up
 \Rightarrow some annihilation channels become ineffective
- $m_{\tilde{g}}, m_{\chi_1^0}, m_{\chi_1^\pm}$ are related: so are $m_{\tilde{q}, \tilde{\ell}}$
- μ gets fixed, so the Higgsino component in χ_1^0 cannot be tweaked

mSUGRA-based cMSSM has strong limits...

Red solid: 68% C.L., Blue solid: 95% C.L.

From O. Buchmueller *et al.*, EPJC 74.2922(2014)

Right sneutrino LSP: Constraints to satisfy

- *Lower limit on the stable stau mass*

Right sneutrino LSP: Constraints to satisfy

- *Lower limit on the stable stau mass*

- *Relic density:*

The stau-NLSP decays well after freeze-out

Thus $\Omega_{\tilde{\nu}_R} = \Omega_{\tilde{\tau}_1} m_{\tilde{\nu}_R} / m_{\tilde{\tau}_1}$

$\Omega_{\tilde{\tau}_1}$ obtained by solving Boltzmann equation

*\Rightarrow One can check if $\Omega_{\tilde{\nu}_R}$ is consistent
(only if non-thermal production is neglected)*

*Constraints depend on whether or not
 $m_{\tilde{\tau}_1}, m_{\tilde{\nu}_R}$ come from the same m_0*

Right sneutrino LSP: Constraints to satisfy

- *Big-bang nucleosynthesis (BBN) and light-element abundance:*
 - ⇒ $\tilde{\tau}_1$ -lifetime $\leq 100s$ (approx)
 - K. Ishiwata et al. (2007, 2010)*
 - ⇒ *Constraints on y_ν , $\tilde{\tau}_L - \tilde{\tau}_R$ mixing*
 - ⇒ *constraints on μ*
 - ⇒ *constraints on EWSB conditions*

Right sneutrino LSP: Constraints to satisfy

- *Big-bang nucleosynthesis (BBN) and light-element abundance:*
 - ⇒ $\tilde{\tau}_1$ -lifetime ≤ 100 s (approx)
 - K. Ishiwata et al. (2007, 2010)*
 - ⇒ Constraints on y_ν , $\tilde{\tau}_L - \tilde{\tau}_R$ mixing
 - ⇒ constraints on μ
 - ⇒ constraints on EWSB conditions
- $m_h \approx 125$ GeV + observed LHC signal strengths

Right sneutrino LSP: Constraints to satisfy

- *Big-bang nucleosynthesis (BBN) and light-element abundance:*
 - ⇒ $\tilde{\tau}_1$ -lifetime $\leq 100s$ (approx)
 - K. Ishiwata et al. (2007, 2010)*
 - ⇒ Constraints on y_ν , $\tilde{\tau}_L - \tilde{\tau}_R$ mixing
 - ⇒ constraints on μ
 - ⇒ constraints on EWSB conditions
- $m_h \approx 125$ GeV + observed LHC signal strengths
- LHC and flavour constraints on the SUSY spectrum
(Scan limited to $m_0 \leq 2500$ GeV, $m_{1/2} \leq 2500$ GeV, $A_0 \leq 3000$ GeV)

mSUGRA-based cMSSM limits: all constraints included

mSUGRA-based cMSSM limits: all constraints included

m_{LSP} allowed to be different from m_0

**Looking for two stable stau tracks + ≥ 2 hard (≥ 70 GeV) jets:
three cut sets for stau track identification**

Cut on	Cut set A	Cut set B	Cut set C
β	> 0.85	–	< 0.95
$p_T^{\mu_{1,2}}$	> 200 GeV	> 200 GeV	> 70 GeV
$\sum p_T^{vis.} $	> 700 GeV	> 500 GeV	–
$ y(\mu_{1,2}) $	< 2.4	< 2.4	< 2.5
M_{μ_1, μ_2}	> 1200 GeV	> 1000 GeV	–
$\Delta R(\mu_1, \mu_2)$	> 0.2	> 0.2	–
$\Delta R(\mu, j)$	> 0.4	> 0.4	–
$\Delta R(j, j)$	> 0.4	> 0.4	–

Table 3. The three sets of selection cuts applied in the $\tilde{\tau}_1$ pair analysis. Set C resembles the set of cuts of the ATLAS analysis [62].

Remarks on the cut-sets chosen

- *Cut set A:
Stiff p_T and m_{inv} cuts but only fast tracks
chosen*

Remarks on the cut-sets chosen

- *Cut set A:*
Stiff p_T and m_{inv} cuts but only fast tracks chosen
- *Cut set B:*
 p_T and m_{inv} cuts slightly relaxed, but slower tracks included

Remarks on the cut-sets chosen

- *Cut set A:*
Stiff p_T and m_{inv} cuts but only fast tracks chosen
- *Cut set B:*
 p_T and m_{inv} cuts slightly relaxed, but slower tracks included
- *Cut set C:*
 p_T and m_{inv} cuts much more relaxed but only delayed tracks chosen

Remarks on the cut-sets chosen

- *Cut set A:*
Stiff p_T and m_{inv} cuts but only fast tracks chosen
- *Cut set B:*
 p_T and m_{inv} cuts slightly relaxed, but slower tracks included
- *Cut set C:*
 p_T and m_{inv} cuts much more relaxed but only delayed tracks chosen
- *Conclusion: p_T -based cuts work well for lower stau-masses, but time-delay selection wins for higher masses*

Some signal and background rates: $m_{\tilde{\tau}_1} = 350 - 600$ GeV

Cut set	Benchmark point	N_S	N_B	N_S/N_B	\mathcal{S}
A	BP1	526	5684	0.09	6.7

B	BP1	1337	12772	0.10	11.3
	BP2	1069		0.08	8.9
	BP3	826		0.06	7.0
	BP4	232		0.02	2.0
C	BP1	1543	3481	0.44	21.8
	BP2	1014		0.29	15.1
	BP3	715		0.21	11.0
	BP4	211		0.06	3.5

Table 4. Table showing the number of signal and background events after the selection cuts for the three sets of selection cuts, the ratio N_S/N_B and the statistical significance \mathcal{S} . The integrated luminosity used to compute these numbers is 3000 fb^{-1} .

$\tilde{\nu}_L$ as the lightest MSSM particle...

- *Problem with direct DM search: unsuppressed coupling with the Z implies high elastic scattering rates*

$\tilde{\nu}_L$ as the lightest MSSM particle...

- *Problem with direct DM search: unsuppressed coupling with the Z implies high elastic scattering rates*

- *A possibility: $\tilde{\nu}_L = \tilde{\nu}_1 + i\tilde{\nu}_2$*

Suppose, $\tilde{\nu}_1$ and $\tilde{\nu}_2$ are split in mass.

A tiny $\Delta L = 2$ mass term can do it

L. Hall, T. Moroi, H. Murayama (1998); E. Ma, U. Sarkar (2012); A. Chatterjee, N. Sahu (2014)

Z - $\tilde{\nu}_1 - \tilde{\nu}_2$ coupling is required for DM scattering: a mass split ≈ 300 keV can prevent it for $\Delta m > mv_{\text{esc}}^2/2$

D. Smith, N. Weiner (2001)

Direct search constraints thus evaded

$\Rightarrow \tilde{\nu}_L$ LSP possible

$\tilde{\nu}_L$ as the lightest MSSM particle...

- $SU(2) \Rightarrow m_{\tilde{\nu}_L}$ has close-by $m_{\tilde{l}_L}$

$\tilde{\nu}_L$ as the lightest MSSM particle...

- $SU(2) \Rightarrow m_{\tilde{\nu}_L}$ has close-by $m_{\tilde{l}_L}$
- A distinctive signal at the LHC: same-sign trileptons (SS3L)
A. Chatterjee, N. Chakrabarty, *BM, Phys. Lett. B754, 14 (2016)*

Same sign trileptons (SS3L)...

*Suppressed in R-parity conserving SUSY
Negligible standard model background*

In this case,

Any cascade to $\chi_1^0 \Rightarrow \tilde{l}_L$ produced in $\approx 50\%$ cases

The two associated leptons are of same sign in 50% events

One more ℓ from the cascade produces SS3L

SM background $\leq 10^{-3}$ fb, fakes removed by a hard MET cut (≥ 100 GeV)

- *In general,*
both $\tilde{g}\tilde{g} \longrightarrow t_1\tilde{t}_1t_1\tilde{t}_1$
and $\tilde{t}_1^\tilde{t}_1$ production contribute,*
with $\tilde{t}_1 \longrightarrow t\chi_1^0$ and a top giving a cascade
lepton

- *In general,*
 both $\tilde{g}\tilde{g} \rightarrow t_1\tilde{t}_1t_1\tilde{t}_1$
 and $\tilde{t}_1^*\tilde{t}_1$ production contribute,
 with $\tilde{t}_1 \rightarrow t\chi_1^0$ and a top giving a cascade
 lepton
- *If χ_1^\pm, χ_2^0 are light enough,*
 the \tilde{t}_R in \tilde{t}_1 contributes more for $\chi_1^0 \simeq \tilde{B}$

- *In general,*
 both $\tilde{g}\tilde{g} \rightarrow t_1\tilde{t}_1t_1\tilde{t}_1$
 and $\tilde{t}_1^*\tilde{t}_1$ production contribute,
 with $\tilde{t}_1 \rightarrow t\chi_1^0$ and a top giving a cascade
 lepton
- *If χ_1^\pm, χ_2^0 are light enough,*
 the \tilde{t}_R in \tilde{t}_1 contributes more for $\chi_1^0 \simeq \tilde{B}$
- *Mostly, SS3L \Rightarrow SS4L, though with smaller rate*

Same sign trileptons (SS3L)...

*With $\tilde{\nu}_L$ at the bottom, one predicts
 $\approx 25\text{-}30$ ($35\text{-}40$) events in LHC@13 TeV (14 TeV),
with $\int \mathcal{L} dt = 100\text{fb}^{-1}$, for
 $m_{\tilde{g}} = 1.6\text{TeV}$, $m_{\tilde{t}_1} = 1.0\text{TeV}$,
 $m_{\chi_1^0} = 600\text{GeV}$, $m_{\tilde{\nu}_L} \approx 300\text{GeV}$
The main SUSY signal, namely, jets + 0ℓ + MET,
reduced by more than a factor of 2*

A. Chatterjee, N. Chakrabarty, BM (PLB, 2016)

With $\tilde{\nu}_L$ LSP, $SS3L$ is suppressed only for

- $\tilde{t}_1 \simeq \tilde{t}_L$, \tilde{t}_R heavy, lighter chargino

With $\tilde{\nu}_L$ LSP, $SS3L$ is suppressed only for

- $\tilde{t}_1 \simeq \tilde{t}_L, \tilde{t}_R$ heavy, lighter chargino
- Generally, decays into χ_1^0 bypassed

With $\tilde{\nu}_L$ LSP, SS3L is suppressed only for

- $\tilde{t}_1 \simeq \tilde{t}_L, \tilde{t}_R$ heavy, lighter chargino
- Generally, decays into χ_1^0 bypassed
- Highly compressed spectrum

With $\tilde{\nu}_L$ LSP, SS3L is suppressed only for

- $\tilde{t}_1 \simeq \tilde{t}_L, \tilde{t}_R$ heavy, lighter chargino
- Generally, decays into χ_1^0 bypassed
- Highly compressed spectrum
- $2l/0l$ ratios can be useful in such cases

In probing any dark matter scenario in accelerator experiments, it may be too restrictive to think in terms of stereotyped signals!

For $m_{\text{stau}_1} \approx 440 \text{ GeV}$, $\tan \beta \approx 33$

- *General BBN constraints satisfied by tweaking $m_{\tilde{\tau}_R}$ vs. $m_{\tilde{\nu}_R}$
