Solar cells based on cu2znsns4/n-si heterojunction

Thursday, 7 February 2019 14:30 (10 minutes)

The semiconducting compound Cu2ZnSnS4 (CZTS) is made up earth-abundant, low-cost and non-toxic elements, which make it an ideal candidate to replace Cu(In,Ga)Se2 (CIGS) and CdTe solar cells which face material scarcity and toxicity issues. In addition, as an important compound thin film absorber material, CZTS exhibits superior optical and electronic properties, as well as a suitable band gap (approx. 1.5 eV). It is well known that CZTS has a great light absorption coefficient of more than 104 cm-1 in the visible light region, and its theoretical power conversion efficiency (PCE) is more than 30%.
